Acknowledgments

The inspiration for this volume materialized under the tutelage of Benjamin Elman and Angela Creager in the years of my graduate study at Princeton University. The breadth of Ben's and Angela's erudite knowledge proved to be far more than what my insatiable appetite for theory and intellectual history could absorb. Their mentorship led me to immerse myself deeply in the literature on historical epistemology and to think about its relation to the history of East Asian science and medicine. This is reflected not only in the various response papers that I wrote for their seminars, but also in the dissertation that I eventually completed under their co-supervision. In light of their impact on my intellectual development, it is to them that this book is dedicated.

For the reproduction of the cover image (which also appears in Chapter 6), I gratefully acknowledge a contribution from the Wellcome Trust Strategic Award titled "Situating Medicine: New Directions in the History of Medicine," which is administered by the Centre for the History of Medicine at the University of Warwick.

This volume is the brainchild of a major international conference that I co-organized with Carla Nappi and Volker Scheid in 2010. The title of the conference was "The (After)Life of Traditional Knowledge: The Cultural Politics and Historical Epistemology of East Asian Medicine," and it was hosted by the EASTmedicine (East Asian Sciences and Traditions in Medicine) Research Centre at the School of Life Sciences, the University of Westminster in London, on August 20–1, 2010. I acknowledge the Chiang Ching-Kuo Foundation for International Scholarly Exchange for providing a European Region Conference Grant (CS-007-U-09), and the Arts and Humanities Research Council for a Traditional East Asian Medicines Research Network Grant that made the conference possible. I thank my co-organizers, Carla and Volker, for seeing the project through its different stages, and all of the speakers who shared their groundbreaking research in the summer of 2010. Because of Carla's and Volker's expertise, we were able to put together a program that was much more chronologically and geographically diverse than the scope of what is represented in this present volume. Although I invited only those papers that focus

on Chinese medicine in the modern period for inclusion in the anthology, this decision should by no means undervalue those conference papers that have been left out. The choice merely serves the strategic purpose of producing a volume that is concise, focused, and manageable in scope. I hope the dialogues and debates generated by this book will further our thinking on the history of medicine across the whole of East Asia and, indeed, the globe.

Howard Chiang
